

C6L2 Biological Evidence

Across

- 2. Parts of an organism that are similar in origin and structure
- 4. If species inherited many of the same genes from a common ancestor then would have similar body structures
- 6. The growth and development of an offspring from fertilization to birth
- 8. The study of similarities and differences in the physical structures of living things
- 9. Parts that look similar, but are passed down from different ancestors

- 10. A record tht scientists have that shows all of the fossils they've found in order by year they were alive

Down

- 1. A diagram that shows evolutionary changes
- 3. Body parts that have no function
- 5. Change over a long period of time within a species
- 7. Ancestors with a more similar pattern in their DNA
