

C6L2 Biological Evidence

Across

- 9. Body parts that have no function in their present - day form.
- 10. If species inherited many of same genes from a common ancestor, then they would have similar body structures and development.

Down

- 1. Are parts of organisms that are similar in origin and structures.
- 2. A diagram that shows evolutionary relationships
- 3. It is the study of similarities and differences in the physical structures of living things.

4. A species that has gotten DNA pasted down from it.

5. Parts that look similar, but are passed down from different ancestors.

6. Every fossil that has been found in a record.

7. Fossils in the fossil record support the theory evolution by natural selection.

8. The study of the growth and development of offspring from fertilization to birth.
