

# Cardiovascular and Respiratory Drugs

## Across

2. Is a short acting B2 agonist.
3. Affects conduction velocity through the conducting tissues of the heart.
6. Used for people with asthma who need both an ICS and LABA medicine.
8. Inhaled corticosteroid.
10. Inhibits reabsorption of sodium and water in the proximal and distal tubules.
11. Suppresses the cough reflex by numbing the stretch receptors in the respiratory tract and prevents the cough reflex from being stimulated.

13. Works on the heart muscle by influencing contractility or the strength of the contractions. (force)

14. Inhibits reabsorption of sodium and water in the loop of Henley.

15. Increases contractility of the heart by decreasing the workload.

## Down

1. Corticosteroid that is inhaled through the nare.
4. Affects the conduction of the heart (HR).
5. An expectorant that reduces the viscosity of secretions.

7. Reduces the activity of angiotensin converting enzyme which causes relaxation of blood vessels as well as a decrease in blood volume.

9. Long-acting beta2 adrenergic agonist. (LABA)

12. Blocks angiotensin receptors causing vasodilation and increased salt and water excretion.
