# Cell Membrane

## Across

2. Serves as a name tag for the cell
5. Moving water from high concentration to low concentration
6. A membrane protein which is only found on one side of the membrane
7. The release of materials, within vesicles, by fusing with the cell membrane
9. A type of passive transport that occurs when molecules diffuse across a membrane through transport proteins

10. Moving molecules across the cell membrane which requires energy

11. A process where the cell's membrane folds inwards to bring materials into the cell

## Down

1. Repels water
3. The cell membrane only allows certain things to pass through
4. A substance passing through the membrane without the aid of a membrane protein
8. A thin double layer of phospholipids
