

Ecological Relationships

Across

6. relationship in which one species benefits and the other is harmed
7. evolution (adaptive change) of two or more species based on their shared interactions
8. an animal that eats only plants
9. the interactions between two or more different species living in close physical association with one another
10. two different species benefit from their relationship with one another

Down

1. adaptation in some animals that causes them to look like something else in their environment (insect has the same body shape as a leaf)
2. a symbiotic relationship in which one species benefits but the other is neither helped nor harmed
3. an animal that eats both plants and animals
4. an organism that gets its nutrients by feeding on another living organism
5. an animal that eats only other animals
