

# End User

## Across

**6.** One set of related values for all of the columns declared in a given table. Also known as a record occurrence.

**9.** Database Definition Language.

**10.** An entity that licenses an Application for its own use from Licensee or its Additional Reseller

**11.** The means of communication between a client and a server. A process may have multiple connections opened, each in its own thread, to one or more databases at a time.

## Down

**1.** The basic unit of database file input/output. Database files may be organized into a set of fixed-sized pages containing data associated with one or more record occurrences (table rows).

**2.** A Seat that resides on a single Server machine and is capable of accepting connections from one or more Seats residing on Client machines.

**3.** A foreign key attribute that automatically migrates the changes made to a referenced (i.e., primary key) table to all of the referencing (foreign key) table rows.

**4.** A single unit of named data that has a particular data type (e.g., number, text, or date). Columns only exist in tables

**5.** The common name for standardized local-area wireless technology.

**7.** Graphical User Interface.

**8.** A column or columns on which an index is constructed to allow rapid and/or sorted access to a table's row.

**12.** Occurs when a lock request has waited longer than the prescribed wait time for the request to be granted.
