# Floating Flora

## Across

7. Typically grow near or on the shorelines of lakes or ponds but can handle varying water depths
8. Rooted floating plant that has pads
9. A rooted floating plant that is a water lily that has adapted to have water roll off of its leaf surfaces
10. These are small openings on plants typically on leaves and stems that allow for the exchange of gasses.
11. Emergent plant famous for papermaking by the ancient Egyptians

## Down

1. These plants are completely underwater and are great at oxygenating water through photosynthesis.
2. Water lilies fall into this category and their roots often dangle down in the water.
3. Typically found around a lake's shoreline that serves as an interface between the upland landscape and aquatic habitats.
4. An aquatic carnivorous plant that has small bladders underwater to help get small invertebrates that they eat
5. Native emergent plant that grows in Florida swamps and the leaves look like alligator heads
6. Are emergent plants that are carnivorous. They are not venus flytraps
