

Geometry Terms: Crossword

Across

- 1. Two non-adjacent angles formed by two intersecting lines are called what?
- 4. What type of angle measures to be greater than 180 degrees?
- 9. What is a flat surface made up of points that extends indefinitely called?
- 10. What is made up of two non-collinear rays with a common end point or vertex?
- 11. The common endpoint of an angle is called a what?

12. Part of a line with an endpoint and that extends indefinitely in one direction is called what?

- 13. What is it called when the points are not in a straight line?
- 14. What do we call a ray that divides an angle into two congruent angles?
- 15. What type of angle measures to be less than 90 degrees?
- 16. What type of angles lie in the same plane, have a common vertex, a common side, but no common interior points?

Down

- 2. What kind of angles add to be 90 degrees?
- 3. What type of angles add to be 180 degrees?
- 5. What type of angle measures to be exactly 180 degrees?
- 6. What type of pair forms when when a pair of adjacent angles, whose non-common sides are a opposite rays, add up to be 180 degrees?
- 7. Perpendicular lines intersect to form what kind of angles?
- 8. What has two end points and can be measured?
