

Geometry Terms Grade 6

Across

- 2. The sum of two angles is 90
- 4. A polygon with four sides
- 13. A pair of angles are formed when two straight lines intersect. The two angles are directly opposite each other through the vertex.
- 14. It passes through two distinct points and continues endless in both direction
- 15. A flat surface such as a sheet of paper or a white board
- 17. two lines meets at a point and forms 90 degrees

- 19. A triangle that none of sides are equal in length
- 20. 90 degrees angle
- 21. It joins the two distinct point. So it allows us to measure the length.

Down

- 1. A tool that we can use to measure an angle
- 3. A polygon with five sides
- 5. an angle between 90 and 180
- 6. The sum of two angles is 180

- 7. an angle between 180 and 360
- 8. A triangle that all sides are equal in length
- 9. 360 degrees angle
- 10. It is a point and can be found in an angle, a polygon, a polyhedron
- 11. A triangle that two sides are same in length
- 12. It starts at a point, passes through another point, and continues on endlessly.
- 16. A polygon with three sides
- 18. Two straight lines do not meet in a plane
