Name: _____ Date: _____ Period: _____

Geometry Vocabulary

Across

3. The point of concurrency of the medians of a triangle.

7. The location at which two lines, line segments, or rays intersect.

8. Having the same size, shape, and measure.

11. A figure created by two distinct rays that share a common endpoint (also known as a vertex)

12. Sides that have the same relative position in geometric figures.

Down

1. Figures that have the same size, and shape

2. A line that acts as a mirror so that corresponding points are the same distance from the mirror.

4. A part of a line between two points on the line.

5. A figure before a transformation has taken place.

6. The point at which two or more lines intersect or cross.

9. One of the basic underfined terms og geometry; Traditionally thought of as going on forever in all directions (in two-dimensions) and is flat (i.e., it has no thickness).

10. A distance preserving map of a geometric figure to another location using a reflection, rotation, or translation.
