# Human Body Lessons 1-3

- |  |                       |
|--|-----------------------|
| 1. Has a specific function necessary to the life or activity of the body               | A. Cells              |
| 2. Parts of the body that work together  | B. Muscle             |
| 3. Flexible, connective tissue, often acts as a cushion between two meeting bones      | C. Bones              |
| 4. Strong, hard objects that give structure, protection and support                    | D. Tendon             |
| 5. Bendable tissue that attaches connecting bones                                      | E. Voluntary muscle   |
| 6. Place where separate bones meet and connect   | F. Ligament           |
| 7. Extremely small units that together form the organs and tissues                     | G. Involuntary muscle |
| 8. Fibrous, stretchy tissue that helps with movement and helps many of the organs work | H. Relaxing muscle    |
| 9. Muscle that becomes shorter in length   | I. Joint              |
| 10. Muscle that becomes longer in length   | J. Organ              |
| 11. Muscle that contracts naturally without thought                                    | K. Cartilage          |
| 12. Muscle that contracts under the control of the individual                          | L. System             |
| 13. Connective tissue that connects muscle to bone                                     | M. Contracting muscle |
