

Organ Systems

Across

1. Controls body functions by using hormones- maintains homeostasis
 3. This is a response to a harmful threat or attack- perceived causing an adrenaline rush
 9. This is part of the Male's reproductive system- this is steroid (hormone)
 10. Creates the offspring- Sexual and Asexual
 11. A hormone in the female's reproductive system- promotes growth to the body

14. Part of the male's reproductive system- up to 250,000 of these are produced in a single day

Down

2. A stable substance developed in an organism which transports to tissue fluids to provide more functions to the cell- creates a stimulant response.
 4. A large gland that secretes blood and helps maintain a normal body temperature
 5. A part of your body also classified as an "organ"- secretes chemical substances to help the body

6. These glands live right above kidneys. They produce hormones you can't live without.

7. The "organ" that produces male reproductive cells.
 8. Maintains a stable condition throughout the body
 12. The female "organ" which produces eggs to reproduce to create an offspring
 13. Part of the women's reproductive system- need them to create babies
