

Sensation and Perception

Across

6. keenness or sharpness of vision

7. the sense that provides information about the position of the body

10. neurons that are sensitive to light

11. transparent structure of the eye that focuses light on the retina

12. inability to clearly distinguish different colors of the spectrum

13. the adjustment of the eye to low light intensities

Down

1. colors across each other on the color wheel

2. visual impression that remains after the original image has been removed

3. provides side vision and the ability to see in dim light

4. dark circular hole in the center of the iris

5. part of the retina that contains no photoreceptors

8. the light sensitive inner surface of the eye that contains the rods, cones, and neurons that process visual stimuli

9. receptor cell in retina responsible for color vision and respond best in bright light
