

Surface and Groundwater Crossword

Across

8. any land area that is covered with water for a part of the year
 11. bodies of water surrounded by land
 13. The increased amount of water can begin to erode the sides of a stream and cause it to bend or curve
 14. steep sides that hold the moving water within them
 15. receive their water from precipitation and they support unusual plant life due the highly acidic soil
 17. when a stream erodes away a high area to combine with another stream and draws water away from that stream
 18. a process that occurs in lakes that involves the surrounding watershed enriching the bodies of water with nutrients to stimulate plant growth

19. the elevation at which a stream enters another stream or body of water
 20. the area of the stream that leads into a large body of water

Down

1. formed when a meander becomes so curved that the stream eventually cuts it off to go straight again
 2. -when small streams erode away the rock at the head of the stream
 3. form along the mouth of streams and extensive deltas and they have a constant supply of water so this allows for marsh grasses to grow rapidly
 4. sloping depositional features formed at the bases of slopes and are composed of mostly gravel and sand
 5. the curved parts of a river that move fastest on the sides and carves the edges of the river

6. when a geologic process lowers the base level of a stream
 7. narrow pathways carved into rocks from runoff of precipitation
 9. all of the land area that drains into a stream system
 10. part of the river that is fastest in the middle and slower on the edges due to friction
 12. low lying areas located near streams and can form from marshes
 16. the region where water first accumulates to supply a stream
