

# Water Cycle

## Across

4. The process of a state of water falling to the surface  
 5. A space where groundwater is stored  
 6. A layer of rock which water is able to pass through  
 12. Water entering an aquifer  
 15. A low lying area which is prone to flooding  
 16. A body of water which supplies a bigger body of water  
 17. A zone which contains no water UNSATURATED  
 19. The process of plants releasing water or vapor into the atmosphere

22. The process of water seeping through a permeable layer

25. A layer of rock which water is not able to pass through

26. The process of water going down a permeable layer

## Down

1. The measure of how permeable a layer is  
 2. Water which is stored on the surface  
 3. The ground which a river flows on  
 7. The measure of how many pores a object has  
 8. A space which holds water  
 9. An area which separates where water flows in that area

10. The process of turning water from a liquid to a gaseous state

11. The process of vapor turning into a cloud

13. A man-made well which is contained

14. Water that is exiting an aquifer

18. A zone that contains a good amount of water SATURATED

20. Water which moves into the ground through infiltration

21. The top of the saturated zone WATER

23. A body of water connecting 2 bigger bodies of water

24. A contained well which rises above the water table
