

# biology

## Across

- 4. a primate of a taxonomic tribe, which compromises those species regarded as humans, directly ancestral to humans or closely related
- 8. shows relation between extinct and current organisms
- 9. a primate of a family that includes human and their fossil ancestors and also at least some of the great apes
- 10. an organ or a bone that appears in different animals, demonstrating descent from a common ancestor

## Down

- 1. A concept theorized by Charles Darwin; adjustments of genes throughout generations based on factors that help it survive
- 2. the gradual development of something, especially from a more simple to a more complex form
- 3. having more offsprings than resources available
- 5. transfer of alleles from one population to another
- 6. the preying of one animal on others
- 7. ability to survive not reproduce
